# Research Data Bootcamp:
Data Publishing and CU Scholar

Melissa Cantrell, Assistant Professor, Scholarly Communication Librarian
Interim Lead, Data and Scholarly Communication Services

Matthew Murray, Data Librarian

Tuesday May 16, 2023
Agenda

1. What is data publishing?

2. Why publish data?

3. How to publish data

   a. Intro to FAIR principles

   b. Top considerations

   c. CU Scholar demonstration

4. Questions and wrap-up

2. What is data publishing?

Working definition

- Making research data and metadata/documentation publicly available (or with appropriate access controls) via a formal web-based repository/database
- Preferably in adherence with <u>FAIR data principles</u> and/or other standards for data, metadata, and repository quality

Related terms

- Data sharing
- Data curation
- Data archiving
- Data preservation

3. Why publish data?

Why publish data?

1. Scientific and public good
   a. Advance scientific innovation
   b. Address reproducibility
2. Journal/publisher requirements
   a. "Data availability statements"
   b. FAIR repositories with citations via persistent IDs
3. Funder requirements
   a. Part of NSF data management plans since 2011

4. How to publish data
Introduction to FAIR data principles ([Wilkinson et al., 2016](#))

Findable (F)

- Apply a globally unique and persistent identifier
- Describe your data in a data repository

FINDABLE

Unique identifiers and metadata are used to allow data to be located quickly and efficiently

Accessible (A)

- Consider what will be shared, and share via a open, free, and universally implementable protocol
- Metadata are valuable and accessible, even when the data are no longer available

ACCESSIBLE

Data is open, free and universally available for research discovery efforts

Interoperable (I)

- Use:
  - Open formats
  - Consistent vocabulary
  - Common metadata standards

INTER-OPERABLE

A common programming language is used to allow use in a broad range of applications

Reusable (R)

- Origin, context, history, and who to credit/cite are all crucial for data reusability
- Consider permitted used and apply the appropriate license

REUSABLE

All data is clearly described and outlines associated data-use standards

Top Considerations for You # 1

Have clear documentation and a data management plan from square one.

- Think ahead about repositories and requirements for a finished project
- Document throughout the process/project: how data was created/gathered/used/etc.
- R (Reusable) in FAIR is very hard to achieve just at the end of the project; important to think about from the beginning

Top Considerations for You # 1

Consider data sharing and publishing prior to collection.

Before you start collecting data, think about:

- How much of your data will you/can you share?
- How and where will you share your data?
- When will you share your data?
- With whom will you share your data?

Top Considerations for You # 2:

Select a FAIR-aligned data repository

- CU Scholar
  - FAIR-aligned public access repository for CU Boulder-affiliated researchers (i.e., have a CU IdentiKey)
  - Has CoreTrustSeal certification
  - Review and curation of all data sets
  - DataCite DOIs registered for all data sets
  - Public access to large data sets via Globus and PetaLibrary

Top Considerations for You # 2:

Select a FAIR-aligned data repository

- General repositories (e.g., Dryad, Dataverse, Zenodo)
  - Open to anyone to deposit
  - Minimal review/curation of deposits
  - Typically provide DataCite DOIs and usage metrics
  - Size limits and/or additional fees for large data
- Domain repositories:
  - Re3data repository registry
  - Level of review/curation varies
  - Ability to deposit varies
  - May be recommended/required for certain data types by funders/publishers (e.g., Springer-Nature's list)

Top Considerations for You # 3:

Consider copyright and licensing of your data set

- The license that is selected facilitates sharing and reuse of the data set
  - [Creative Commons](#)
  - CC BY: Creative Commons Attributions License
  - CC 0: When an owner wishes to waive their copyright and/or database rights
  - Public Domain mark (PDM): It is used to mark works that are in the public domain, and for which there are no known copyright or database restrictions.
Top Considerations for You # 3:

Consider copyright and licensing of your data set

- Computer code has a lot of different licenses available

GitHub
